

CLIENT DISCOVERY MEMO

COURSE CODE: DCIT 208

ASSIGNMENT NUMBER: 2

ASSIGNMENT TITLE: Client Discovery Memo

FULL NAME: Asi Nyama Frimpong-Anin

STUDENT ID: 22371062

INDIVIDUAL REPOSITORY:

<https://github.com/Dept-of-Comp-Sci-University-of-Ghana/dcit208-individual-engineering-evidence-portfolio-2026-nyama-aa>

TEAM NAME: JASKON-Tech

PROJECT TITLE: ArchiVerse — A Centralized Project Tracking and Client Engagement System for Asamoah Welbeck & Associates

TEAM REPOSITORY: [github.com/Dept-of-Comp-Sci-University-of-Ghana/dcit208-client-project-2026 team-engineering-repository-seg26-44-jaskon-tech](https://github.com/Dept-of-Comp-Sci-University-of-Ghana/dcit208-client-project-2026-team-engineering-repository-seg26-44-jaskon-tech)

AI DISCLOSURE STATEMENT

AI assistance was used to structure and format this document, and to help organize the interview summary, requirement transformation, and reflection based on the client discussion and requirements gathered by the team. All client requirements, use cases, and design decisions reflect the team's actual work and were reviewed and verified before submission.

A. PERSONAL QUESTION SET

1. How do you currently receive and record new project requests from clients?
2. How do you assign projects and monitor progress among architects and other staff members?
3. What difficulties do you experience when tracking project deadlines and milestones?
4. Are there any repetitive tasks in your current process that you would like the system to automate?
5. What client information must be captured before a project can begin?
6. What types of project records such as drawings, contracts, invoices, or reports should the system maintain?
7. What outcomes would convince you that the new system is meeting your business needs?
8. Which system features would provide the greatest value to your employees and clients?
9. What security measures should be in place to protect sensitive client information and project documents?
10. . How should the system respond if incorrect project information is entered or a document fails to upload?
11. Which reports or summaries would you like the system to generate automatically?

B. INTERVIEW EVIDENCE

DATE: 2ND JULY 2026

TIME: 10 am

MEDIUM: In-Person meeting

PARTICIPANT ROLE: Client representative and project team members

EVIDENCE TYPE: Client Interview

MEETING SUMMARY

Our group met with the client to discuss the system requirements and make sure we understood what they needed before development started. We went through the features we had proposed and asked for their feedback.

The client confirmed that they wanted clients to be able to track the progress of their projects, upload and download blueprint files, book consultations, and communicate with architects through the system. They also wanted visitors to be able to view the company's services and previous projects.

During the meeting, the client mentioned that the system should be simple to use and not be difficult to maintain after it is deployed. We also discussed user access, and the client agreed that administrators, architects, and clients should each have different

permissions. Based on the discussion, we updated our requirements to include project notifications and role-based access control.

C. REQUIREMENT TRANSFORMATION

Raw Client Statement	"The system should let clients monitor their project progress"
Functional Requirement	The system shall allow logged-in clients to view the progress of their assigned projects.
Non-Functional Requirement	The project progress page should load within 3 seconds under normal internet conditions.
User Story	As a client, I want to view the progress of my project so that I know its current status
Acceptance Criteria	• The client must be logged in before viewing their project progress. • The system shows a display of the current project status. • Only projects assigned to the logged-in client are displayed. • The latest changes made to the project is shown. • If no updates exist, the system displays an appropriate message.
Possible API/Interface Implication	The system should provide an endpoint such as GET /projects/{id}/progress for retrieving the progress of a client's project.
Data Implication	The database must store the project ID, client ID, project status, progress updates, and the date of the latest update.
Test Idea	Log in as a client and verify that only the client's assigned project is displayed and that the project status matches the stored data.
Open Question	Should the clients receive email notifications whenever the project status changes, or should updates only appear after they log into the system?

D. REFLECTION

Before meeting with the client, I assumed that the main purpose of the system was to showcase the architectural firm's services and complete projects. I thought most of the work would focus on creating a professional website with a portfolio and contact page, while project management features would only play a minor role.

After speaking with the client, my understanding of the project changed. It was clear that the client wanted a system that would support both the company and its clients throughout the entire project lifecycle, not just advertise the firm's services. During the discussion, the client repeated the need to allow the clients to monitor project progress, upload and access blueprint files, book consultations, and communicate directly with architects. They also highlighted the need for secure user authentication and different access levels for administrators, architects, and clients. This helped me understand that the project is more than a company website; it is a web-based project management system.

One assumption that became false was my belief that a portfolio website would be enough to meet the client's needs. The interview showed that the client was looking for a system that improves communication, project tracking, and document management. Another assumption that became stronger was the need for a simple and user-friendly interface. The client repeatedly mentioned that the system should be easy to use and maintain after deployment, confirming that usability is an important non-functional requirement.

Overall, the meeting helped me understand why talking to the client is an important part of requirements gathering. Instead of making assumptions about what the client wanted, we were able to confirm the requirements directly and make changes where necessary. As a result, features such as project progress tracking, consultation booking, notifications, and role-based access control were included in the final requirements.

AI DISCLOSURE

Date	Tool	Prompt Summary	Output Used	Output Rejected	Verification Method
3 RD JULY 2026	ChatGPT (OpenAI)	Used to structure and refine interview summary, requirement transformation, and reflection based on client meeting and SRS.	Improved formatting, clearer wording, structured requirement transformation and reflection sections.	Overly formal wording and some phrases that did not match group SRS style.	Cross-checked with group SRS document and client validation notes; edited output to ensure consistency with actual requirements and project scope.
