

Course Code : DCIT 208

Assignment Number : 1A 2

Assignment Title : Client Interview Evidence and Requirement Transformation Memo

Full Name : OSEI-HENE OWURAKU DANQUAH

Student ID : 22372680

Team Name : JASKON-Tech

Project Title : ArchiVerse — A Centralized Project Tracking and Client Engagement System for Asamoah Welbeck & Associates

Team Repository URL : <https://github.com/Dept-of-Comp-Sci-University-of-Ghana/dcit208-client-project-2026-team-engineering-repository-seg26-44-jaskon-tech>

Individual Portfolio Repository URL : <https://github.com/Dept-of-Comp-Sci-University-of-Ghana/dcit208-individual-engineering-evidence-portfolio-2026-owura6789>

Date : 2nd July, 2026

AI Disclosure Statement:

I used AI assistance. The details are provided in the AI Disclosure section at the end of this report.

Current Workflow:

1. How do you currently manage architectural projects and communicate project progress to your clients?
2. What steps do you normally follow from the time a client contacts your company until the project is completed?

Pain Points:

3. What are the biggest challenges you face when managing multiple architectural projects at the same time?
4. Which parts of your current workflow consume the most time or cause the most frustration?

Data Requirements:

5. What information do you collect from clients before starting a project?
6. What project documents, drawings, or files should the new system store and manage?

Success Criteria:

7. What features would make this system successful for your business?
8. How would you know that the new system has improved the way you manage projects and communicate with clients?

Security and Privacy:

9. What information should only be accessible to authorized users, and how important is protecting client data?

Failure and Exception Handling:

10. What should happen if a client uploads an incorrect blueprint or the upload fails because of a network problem?

Additional Discovery Questions:

11. Are there any features you would like to include in future versions of the system?
12. Is there anything about your current project management process that you would definitely want the new system to improve or replace?

Interview / Observation Evidence:

- **Date:** 2 July 2026
- **Time:** 10:00 AM
- **Medium:** In-person meeting
- **Location:** University of Ghana Law School
- **Participant Role:** Client representative from Asamoah Welbeck & Associates
- **Evidence Type:** Client interview and requirements elicitation session

Summary:

In the client meeting, the development team talked to an employee of Asamoah Welbeck & Associates to gain insights on the firm's project management process, difficulties they have, and required features for the upcoming ArchiVerse project management system. This discussion was centered on issues such as project management, management of blueprints, appointment scheduling, communication between the client and the architect, notifications, and access to the project information. It is also important to note that the system should be user-friendly, easy to maintain, and provide protection of confidential project information. Information that can identify individuals has been excluded from this report.

Requirement Transformation:

Raw Client Statement Selected(Paraphrased):

"Clients should be able to monitor project progress."

Functional Requirement

The system shall allow authenticated clients to view the current status of each of their architectural projects through a project dashboard. The dashboard shall display the project name, current status, and the date the project was last updated.

Non-Functional Requirement

The project progress dashboard shall load within **3 seconds** under normal internet conditions. Project status updates made by architects shall be visible to clients the next time the dashboard is refreshed or reloaded.

User Story

As a client, I want to view the progress of my project so that I know its current status.

Acceptance Criteria

- Given a client is logged in, when they open the project dashboard, then they should see the current status of every project linked to their account.
- Given an architect updates a project's status, when the client refreshes or revisits the dashboard, then the updated project status and last updated date should be displayed.
- Given a client has multiple projects, when they access the dashboard, then each project should be listed separately with its name, status, and last updated date.
- Given an unauthenticated user attempts to access the project dashboard, when the request is made, then the system should redirect the user to the login page.
- Given a client attempts to access another client's project, when the request is made, then the system should deny access and return an appropriate authorization error.

API / Interface Implication:

The system should provide a secure API endpoint that allows authenticated clients to retrieve the status of their assigned projects. The project dashboard should display project names, current status, last updated date, and automatically retrieve the latest information whenever the page is refreshed.

Data Implication:

The **Project** entity should include a **Status** field with predefined values such as *Not Started*, *In Progress*, *Under Review*, and *Completed*. It should also store a **Last Updated** timestamp so clients can easily identify the most recent project changes.

Test Idea:

As the QA/Validation Lead, I would test that an authenticated client can successfully view only their assigned projects while unauthorized users or other clients are prevented from accessing project information that does not belong to them. I would also verify that project status updates made by an architect are correctly reflected on the client's dashboard.

Open Question:

Should clients only see a project status label (for example, "**In Progress**") or should the system also display a percentage completion indicator to provide more detailed progress information?

My Reflection:

Before attending the client meeting, I believed that a system for the management of an architectural project should possess many features including extensive reporting facilities, dashboards for analysis, and customizable options in order to be effective. Considering the brief of the project, it seemed that the provision of as many features as possible will add value for the client.

However, at the client meeting, I understood that for the client, the factors of simplicity and usability and the ability to track projects effectively matter more than advanced features. The client specifically mentioned that it was very important for the client to have the facility to track the progress of the project, to be able to communicate with architects and to view project documents from a secure and user-friendly interface.

One assumption that became weaker was my belief that the system should include complex reporting and analytics from the beginning. After listening to the client, I understood that the immediate priority was to build a reliable system that solved the firm's everyday challenges, while advanced features could be considered in future versions of the application.

This changed the way I viewed the system requirements and design decisions. Instead of focusing on additional dashboard features, I now believe the project should prioritize a clear project status dashboard, secure document management, role-based access control, and reliable communication between clients and architects. As the team's

Tester and QA/Validation Lead, this also helped me understand that testing should focus first on the features that are most important to the client's daily workflow before considering optional enhancements.

However, there are still several aspects that require more clarity from the client's side. For instance, I would want to know whether the clients would want to see the status of the project such as "in progress" or whether they would rather see the percent of completion. This will allow me to make the system and testing better.

AI Disclosure Statement:

Date	AI Tool	Prompt Summary	Output Used	Output Rejected	Verification
2 July 2026	Chat GPT/Claude	Assisted in organizing interview questions, refining requirement transformation, improving reflection, and proofreading the report.	Improved wording, structure, grammar, and formatting of the report.	Any generic examples or content that did not match the actual client interview or project requirements.	Compared all outputs with the team's SRS, interview notes, and project discussions to ensure the final submission accurately reflected the client's requirements.

I used AI assistance. ChatGPT and Claude were used a bit to improve the organization, grammar, and presentation of this report. All client information, requirements, and project-specific content were verified against the team's actual interview, meeting

notes, and Software Requirements Specification (SRS). I understand that I am responsible for explaining and defending every part of this submission.
